To examine the prevalence of and trends in opioid-related inpatient hospital admissions and deaths in Maryland from 2008 to 2011.

**METHODS**

- Opioid-related hospitalizations among Baltimore City and Cecil County residents surpassed the state average between 2008-2011.
- Most jurisdictions were above the annual state average of opioid-related hospitalizations resulting in death.
- Opioid-related hospitalizations and mortality vary geographically. Both are important outcomes for understanding the impact of opioid abuse, and help target prevention and treatment resources efficiently.
- Future work will focus on opioid-related emergency department visits.

**CONCLUSIONS & POLICY IMPLICATIONS**

- Opioid-related hospitalizations among Baltimore City and Cecil County residents surpassed the state average between 2008-2011.
- Most jurisdictions were above the annual state average of opioid-related hospitalizations resulting in death.
- Opioid-related hospitalizations and mortality vary geographically. Both are important outcomes for understanding the impact of opioid abuse, and help target prevention and treatment resources efficiently.
- Future work will focus on opioid-related emergency department visits.
